

HOW SOFTWARE CAN HELP WITH GDPR COMPLIANCE

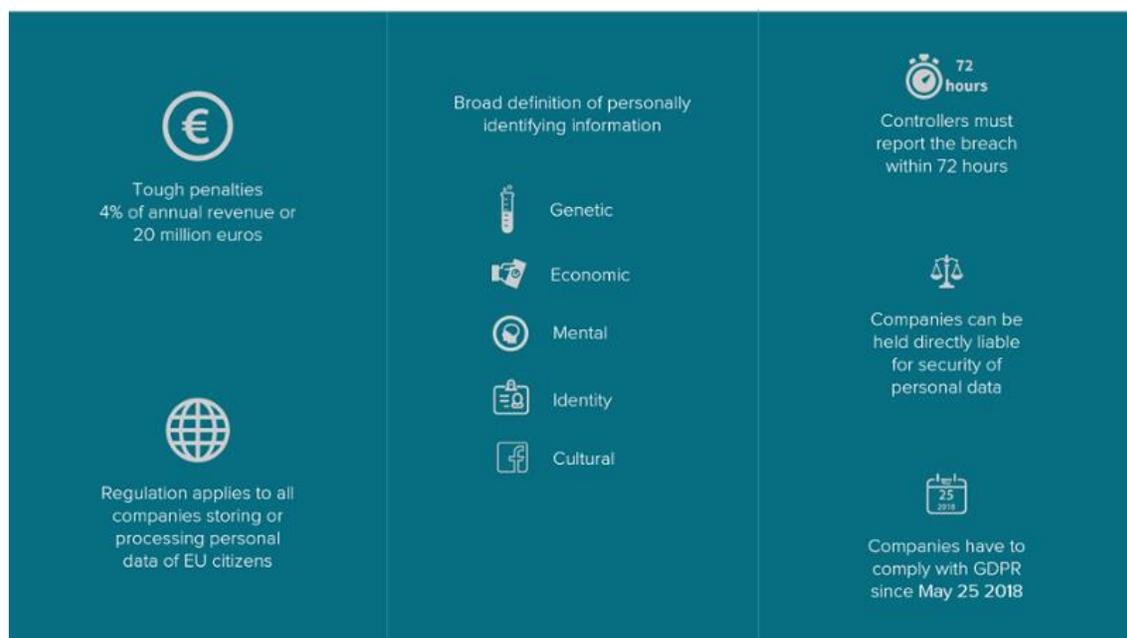

GDPR Webinar Summary

About GDPR

GDPR - the General Data Protection Regulation - has been a massive topic of conversation and controversy before going into effect on the 25th of May. The fact is that any company dealing with information of EU citizens must comply with the rules of protection of individual's data.

Still, many firms continue to struggle with understanding the guidelines and making sure that they are 100% compliant. It is a challenge that involves a fair amount of budget and resources to be solved.

But do not worry there is light at the end of the tunnel: Software companies have implemented GDPR specific products that offer support for streamlining processes around GDPR requests.

How tools can help with GDPR compliance

With the right software it is much easier to become GDPR compliant. Let's take the right of access as one example: More and more companies are getting requests from employees to reveal all the data they have stored about them. For many companies, giving out this sort of information is not so easy as the Personal Identifiable Information (PII) is not always stored in structured files. It could sit in unstructured documents, PDFs, emails, and archives.

Software solutions like ayfie Supervisor can help you "read" a vast amount of unstructured data within seconds, pull reports on all the indexed data and implement the solution effectively within your company. In this process, it is also ensured that no information is missed out in the reports.

Methods like these are much faster than doing it manually, which is what most companies do at the moment.

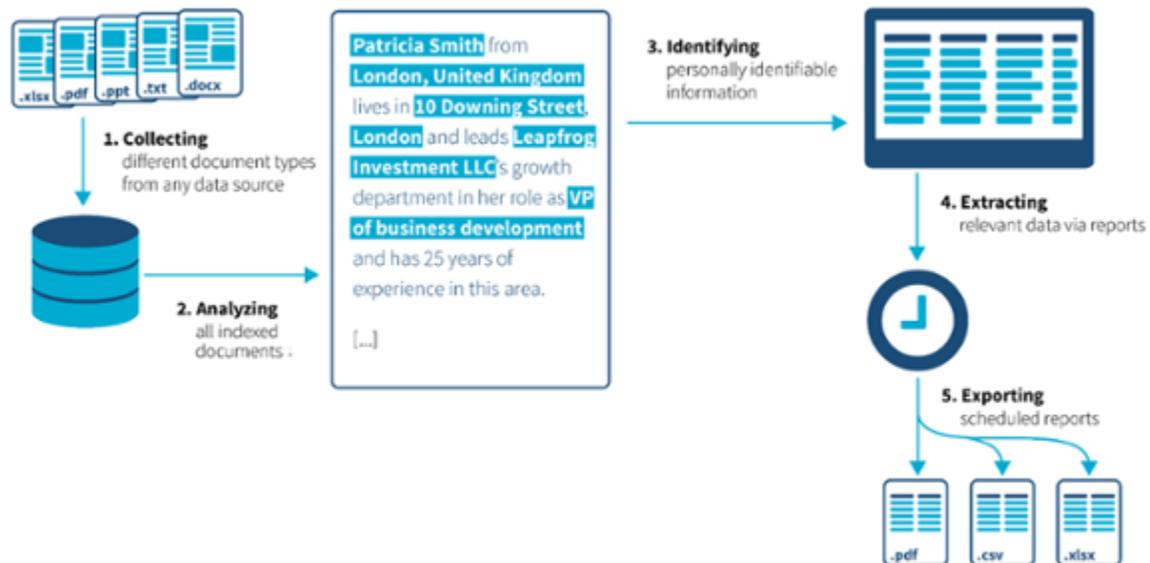

ayfie's approach for providing the right software

ayfie is a market-leading search and text analytics solution that deals with every kind of unstructured data. With ayfie's mixture of statistical-, machine learning- and linguistic capabilities, extracting the data out of the unstructured document is possible. ayfie structures the data for you automatically by, e.g., saying what a personal name, an email or a phone number is. All sorts of PII can be tagged in the document and accessed later on in a report.

ayfie's Enterprise search product Locator, that builds an index of all available data via various connectors is the basis of the GDPR solution ayfie Supervisor. All relevant documents from different data sources are being pulled into a centralized system while respecting the security- and privacy settings as well as the access level of all individual documents.

ayfie has a broad structured index about the documents and the metadata contained in those documents, and we provide a tool on top of that index called ayfie Supervisor. Supervisor gives Security Officers the ability to file reports and define which person is filing which kind of reports as well as which data should be included. These reports can be exported as CSV files or Excel spreadsheet so they can either be processed further in a different workflow step or handed out to individuals.

Here is an overview of how the process works:

If you want to see the solution in action watch the recording of the webinar from minute 16 [here](#).
